

Touch Tone Data -- A Long Way from Touch Tone-Ordered Facsimile Reports

Touch Tone is a familiar name in the oilpatch, thanks to its suite of drilling reports that have served clients for over a decade. Touch Tone Data's signature product, the industry-standard H₂S Search, continues to lead the way with data and functionality critical for well licensing applications according to *Guide 56, October 2003*. But Touch Tone has major changes underway that promise to serve the oilpatch even better.

In June, Touch Tone announced that they had officially joined forces with its sister company, Westcan Petroleum Assets. Sharing ownership, office space and administrative support, it made sense to formally link the companies, creating a synergy that will result in more rigorously reviewed and corrected EUB data, more frequent new product releases and improved training and support.

The new company is XI Technologies Inc.

For those of you who frequently use the Touch Tone analysis and various well data reports, there won't be any change -- except for improvements. All of the same contact people and principals will continue with both companies as new services and support are added.
